

FRONT HUB TOOL SET

This tool allows you to easily remove front hubs, replace bearing outer races, and force fit hubs for FF passenger cars without using press.

Removing a hub from a Nissan car ↓

Provided with a shock absorber mechanism. An impact wrench, if of low pressure, can also be used.

From the caliper mounting holes, the center bolt can be naturally vertically set by joining the planes of the respective parts.

Once set, this tool allows you to perform operations from removal of hubs to force fitting of bearings.

Removing bearings from a Toyota car →

← Force fitting bearings in a Honda car

A combination of the force fit collar adjusted to the outer race outside diameter with the guide adjusted to the inner race inside diameter allows you to perform reliable work.

Notes: Incompatible Types of Cars

For replacing bearings, this tool cannot be used with types of cars where the inner and outer are separate, including FF cars and compact cars manufactured before the beginning of 1970 (those cars excluding Honda cars).

Notes: Contents of the Set

The low-cost FHP-990B Basic Set (only those in the inner box in the photo below), excluding some parts from the FHP-990 Standard Set, is also available. Basically, the set is designed exclusively for removal of hubs and bearings. Accordingly, parts for force fitting bearings and hubs are not included. Support joints are not included, either, so that this set cannot be used with types of cars where the caliper mounting holes are threaded (some Mazda and Daihatsu cars). Please purchase separately required parts.
